

Getting your Mac to work with the LCD projectors/displays at OC

Make sure you have the correct adapter. OC projectors and LCD displays use the VGA connector. Various Macs use various connectors – DVI, mini-DVI, micro-DVI, miniDisplayPort. You need the version that converts the port on your computer to the VGA cable that connects to the projector or display.

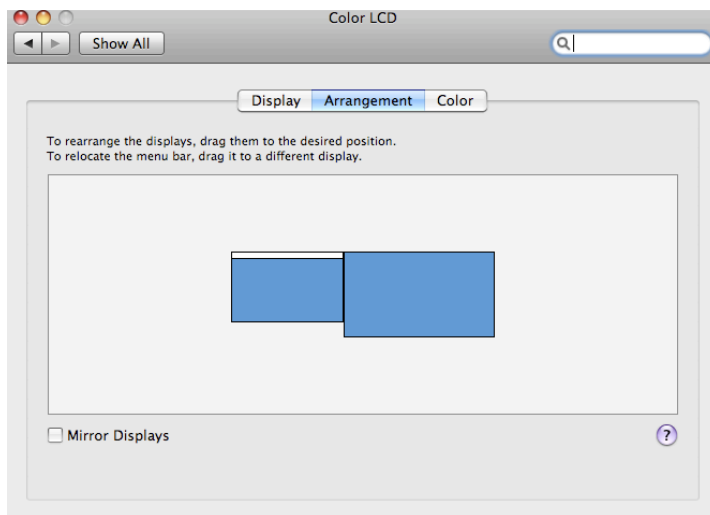

By default some Macs (like the MacBookPro) treat the 2nd display as an extended desktop. You don't get any icons or applications – just the background.

Here's how to make your display mirror:

Open System Preferences

Click on Displays

In the Arrangement tab click on Mirror Displays (bottom left).

Things to know about Samsung 52" LCD displays

Sometimes what shows up on the display isn't very pretty. The image may be off-centre, or distorted. Try this:

Press the Menu button on the display. It should default to Picture and Mode.

Press the + sign to enter the Picture Mode.

Press the down arrow to get to Auto Adjustment.

Press the + sign to activate Auto Adjustment. Wait a moment and the display will adapt to whatever signal is coming from your computer. Usually.
